- def [main](#) ()

#### Variables

- list [header](#) = ["Name", "Cases", "Increased\_cases", "Cured", "Cured\_and\_Sent", "Active", "Deaths", "Deaths\_↔ Today"]
- list [research\\_paper\\_header](#) = ["Title", "link"]
- list [advisories\\_header](#) = ["Date", "Heading", "Link"]

#### 4.1.1 Detailed Description

COVID-19 Tracker.  
Developed by: TwistingTornadoes

#### 4.1.2 Function Documentation

#### 4.1.2.1 advisory\_data\_collection()

```
def covid_data.advisory_data_collection (
    c,
    conn1 )
```

This function crawls the government advisories on COVID-19 from the URL <https://www.mohfw.gov.in/> and inserts it into one of 9 tables listed below:

1. Awareness advisories
2. Behavioural advisories
3. Citizens advisories
4. Employee advisories
5. Hospital advisories
6. Inspirational advisories
7. Travel advisories
8. Training advisories
9. States advisories

Definition at line 240 of file covid\_data.py.

#### 4.1.2.2 create\_advisories\_table()

```
def covid_data.create_advisories_table (
    table_name,
    c )
```

This function creates the advisories table  
uses try and except  
Inside try block we are creating  
a table and in case if table is already  
present inside the database then inside the except block  
we are just printing the message that this table already exists.

Definition at line 184 of file covid\_data.py.

#### 4.1.2.3 create\_research\_papers\_table()

```
def covid_data.create_research_papers_table (
    table_name,
    c )
```

This function creates the research papers table keeping Title as the primary key  
we are using try to create the table inside the database if it does not exist and  
if table exists then control simply passes to except.

Definition at line 288 of file covid\_data.py.

#### 4.1.2.4 create\_table()

```
def covid_data.create_table (
    table_name,
    c )
```

This function creates state-wise tables  
we are using the try block to create the table if it does not exists inside the database  
and simply passing the control if table exists...

Definition at line 25 of file covid\_data.py.

#### 4.1.2.5 insert\_advisories\_data()

```
def covid_data.insert_advisories_data (
    table_name,
    arr,
    c,
    conn1 )
```

This function inserts advisory data into its respective table  
this also includes try and except functionality where inside the try block  
we are inserting the Date,Heading and Link into the table and  
if entry is already present inside the table then  
inside except block we are updating the table entry with new one.

Definition at line 201 of file covid\_data.py.

#### 4.1.2.6 insert\_data()

```
def covid_data.insert_data (
    table_name,
    arr,
    c,
    conn1 )
```

This function insert records in state-wise tables  
we have used try and except functionality  
Inside try block we are inserting the entry inside the table  
whereas updating the entry inside the except block as that entry is already present inside the table.

Definition at line 39 of file covid\_data.py.

#### 4.1.2.7 insert\_research\_papers\_in\_table()

```
def covid_data.insert_research_papers_in_table (
    table_name,
    arr,
    c,
    conn1 )
```

This function inserts records into the research papers table we are using try and except functionality here also where inside the try block we are inserting into the table and if entry already persists then we are updating the table entry inside the except block.

Definition at line 302 of file covid\_data.py.

#### 4.1.2.8 main()

```
def covid_data.main ( )
```

Main function. The flow of control is as follows:

1. Create 'covid\_19\_database'
2. Crawl state-wise data
3. Crawl advisories
4. Crawl research papers

Definition at line 367 of file covid\_data.py.

#### 4.1.2.9 print\_advisories\_data()

```
def covid_data.print_advisories_data (
    table_name,
    c,
    conn1 )
```

This function prints the advisory data inserted in the advisories table

Definition at line 228 of file covid\_data.py.

#### 4.1.2.10 print\_data()

```
def covid_data.print_data (
    table_name,
    c,
    conn1 )
```

This function prints the state-wise data inserted in the table

Definition at line 70 of file covid\_data.py.

#### 4.1.2.11 print\_research\_papers\_data()

```
def covid_data.print_research_papers_data (
    table_name,
    c,
    conn1 )
```

This function prints the contents of the research papers table

Definition at line 329 of file covid\_data.py.

#### 4.1.2.12 research\_paper\_collection()

```
def covid_data.research_paper_collection (
    c,
    conn1 )
```

This function fetches the links of papers from the first 5 pages of google scholar with keywords "covid 19" and adds them to the research paper table

Definition at line 342 of file covid\_data.py.

#### 4.1.2.13 state\_database\_collection()

```
def covid_data.state_database_collection (
    c,
    conn1 )
```

This function crawls state-wise and district-wise data from the URL "https://www.grainmart.in/news/covid-19-coronavirus-india-state-and-district-wise-tally/" and calls functions to execute DML queries

Definition at line 82 of file covid\_data.py.

### 4.1.3 Variable Documentation

#### 4.1.3.1 advisories\_header

```
list advisories_header = ["Date", "Heading", "Link"]
```

Definition at line 20 of file covid\_data.py.

#### 4.1.3.2 header

```
list header = ["Name", "Cases", "Increased_cases", "Cured", "Cured_and_Sent", "Active", "Deaths", "Deaths↵_Today"]
```

Definition at line 18 of file covid\_data.py.

#### 4.1.3.3 research\_paper\_header

```
list research_paper_header = ["Title", "link"]
```

Definition at line 19 of file covid\_data.py.

## 4.2 states\_districts Namespace Reference

### Variables

- string `url` = "https://www.grainmart.in/news/covid-19-coronavirus-india-state-and-district-wise-tally/"
- `r` = `requests.get(url)`
- `soup` = `BeautifulSoup(r.content, 'html.parser')`
- list `states` = []

- list `districts` = []
- list `dis` = []
- int `count` = 0
- list `district` = []
- `geeky_file` = `open('geekyfile.txt', 'wt')`

### 4.2.1 Variable Documentation

#### 4.2.1.1 count

```
int count = 0
```

Definition at line 24 of file states\_districts.py.

#### 4.2.1.2 d

```
dictionary d = {}
```

Definition at line 10 of file states\_districts.py.

#### 4.2.1.3 dis

```
list dis = []
```

Definition at line 22 of file states\_districts.py.

#### 4.2.1.4 district

```
list district = []
```

Definition at line 28 of file states\_districts.py.

#### 4.2.1.5 district\_arr

```
list district_arr = []
```

Definition at line 12 of file states\_districts.py.

#### 4.2.1.6 districts

```
list districts = []
```

Definition at line 21 of file states\_districts.py.

#### 4.2.1.7 geeky\_file

```
geeky_file = open('geekyfile.txt', 'wt')
```

Definition at line 36 of file states\_districts.py.

#### 4.2.1.8 r

```
r = requests.get(url)
```

Definition at line 6 of file states\_districts.py.

#### 4.2.1.9 soup

```
soup = BeautifulSoup(r.content, 'html.parser')
```

Definition at line 7 of file states\_districts.py.

#### 4.2.1.10 state

```
list state = []
```

Definition at line 14 of file states\_districts.py.

#### 4.2.1.11 state\_arr

```
list state_arr = []
```

Definition at line 11 of file states\_districts.py.

#### 4.2.1.12 state\_name

```
string state_name = ""
```

Definition at line 9 of file states\_districts.py.

#### 4.2.1.13 states

```
list states = []
```

Definition at line 8 of file states\_districts.py.

#### 4.2.1.14 url

```
string url = "https://www.grainmart.in/news/covid-19-coronavirus-india-state-and-district-wise-tally/"
```

Definition at line 4 of file states\_districts.py.
